Bellevue, WA | randy@randyzhu.com | github.com/RandoNandoz | linkedin.com/in/rzhu08 | Canadian Citizen · Open to Relocation

EDUCATION

University of British Columbia

Bachelor of Science, Computer Science

Teaching Assistant for Introduction to Computer Systems for 400+ students; Awarded Undergraduate TA Award

May 2028

GPA: 3.88/4.0

EXPERIENCE

Software Engineer Intern

August 2026 – December 2026

NextHop AI

Bellevue, WA

- Prototyped a system for a top-three cloud provider that lets low-cost switches replace expensive edge routers, handling ~80% of traffic locally by caching the most-used routes and sending the rest to one shared large router
- Adapted gribigo, an open-source Go implementation of gRIBI, to run on SONiC so a central controller can update which routes each switch caches
- Automated a customer's SRv6 packet-trimming tests with pytest in sonic-mgmt; unblocked them by fixing a TH6 counter bug in C, traced to a vendor SDK reading the wrong queue

Firmware Developer Intern

May 2026 – August 2026

Netgear

Vancouver, BC

- Fixed screen tearing shipped in every product generation since 2012 by writing a new Linux graphics driver using the fbdev API for the ST7789S panel over Qualcomm's EB12 bus, synchronizing frame DMA to the panel's hardware TE signal
- Cut memory usage ~400MB and flash ~600MB by replacing a WebKitGTK device UI with a native LVGL/C implementation, building the navigation framework, widget library, and 20+ configuration screens
- Contributed new key press events for every key upstream to LVGL, a widely used open-source embedded graphics library that previously supported only the enter key
- Enabled AI agents to develop and verify UI changes without target hardware by writing an SDL2 simulator backend with a mocked device-state layer and screenshot capture

Research Intern

May 2025 – September 2025

University of British Columbia

Vancouver, BC

- Achieved a median speedup of 4.97x on large, open-source codebases with long-running integration tests by building a unit test generation tool targeting pytest using Python using dynamic execution tracing, AST transformations, and serialization
- Integrated an LLM as a dependency classifier to auto-generate mocks for creating correct and deterministic unit tests

Software Developer Intern

September 2024 – April 2025

Teck Resources

Vancouver, BC

- Eliminated ~100 hours of manual data entry with a C# Dataverse-API ingest tool; introduced Playwright + NUnit end-to-end testing that caught 87% of bugs before manual QA

PROJECTS

macOS iSCSI Driver | C++, DriverKit, IOKit

November 2025 – Present

- Building an open-source macOS iSCSI initiator that mounts remote storage as a local disk, providing a free, auditable alternative to \$249/license proprietary tools
- Bridging the userspace networking client to the driver extension over a lock-free shared-memory ring buffer, saturating 2 10Gb SFP+ NICs, working around DriverKit's lack of network access

Racket Compiler | x86_64 Assembly, LLVM IR, gdb, Racket

January 2026 – May 2026

- Cut compile times 180x (3h to 1m) by eliminating a pathological typed/untyped bottleneck in Typed Racket
- Replaced x86-only codegen with an LLVM IR backend, enabling compilation to any LLVM-supported platform

Sasquatch | Swift, ARKit, LiDAR, Detectron2, Open3D, Python, FastAPI, PostgreSQL, GCP

March 2026 (24h Hackathon)

- Deployed an ML pipeline combining Detectron2 instance segmentation and LiDAR point clouds to detect climbing wall holds
- Implemented PCA-based wall orientation detection to project 3D point clouds to 2D for inference
- Reduced false positive rate from 90% to 1% by adding a Gemini validation pass to filter non-hold wall objects

SKILLS

Languages: C, C++, Java, Python, Racket, TypeScript, C#, SQL

Systems: Linux kernel, OpenWrt, LVGL, DriverKit, IOKit, LLVM IR, SONiC

Tools: Git, GDB, CMake, GitHub Actions, Docker, pytest, JUnit
